

# Affecting the sensitivity of optical modules

## Overview

This article will analyze key performance parameters such as transmission rate, wavelength, numerical aperture (NA), output power, and receive sensitivity of optical modules. It will also discuss how to choose suitable optical modules based on practical requirements. Transmitter power characterizes the average optical power output from the laser under rated conditions, while receiver sensitivity indicates the minimum. Industry pundits have recently speculated that demand for 100G/400G switches may take off in 2019, prompting optical transceiver module vendors to sample data center switches with high data transmission rates earlier than expected. It includes an internal automatic power. This article will systematically analyze the core performance indicators of optical modules from five dimensions: transmit optical power, receive optical power, overload optical power, receiver sensitivity, and extinction ratio.
