

## Confirm the main optical path of the splitter is re-recorded

### Overview

In this case use an optical power meter (OPM) and test the input port of the splitter for the optical power level (dBm) from the OLT at 1490 nm. If the power level is reduced it could be as simple as a. An optical coupler is a passive device that can split or combine signals in optical fibers. Some PON splitters have two inputs so it. Optical Time Domain Reflectometers (OTDR) provide graphical data and analysis along the entire length of a cable, but they can be expensive and require more time and skill to operate. OTDR trace results provide insights into fiber health, identifying faults, splice losses, and reflections. All are written in the same straightforward format: what equipment do you need, what are the procedures for testing, options in implementing the test, measurement errors and documenting the results.
