This means the performance of the entire network relies on the data routed and switched by the core switch. Generally, multiple data switches are used at the core layer of a network so that a large amount of data can be routed to the layers in the hierarchy. The layer that lies between the access layer and the. It depends on the requirement. if you need flexibility with different types of interfaces and speeds (copper, fiber, POE, etc) and also Sup redundancy inside the switch then a chassis works usually better than a fixed switch.

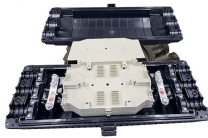

## Core Switch Selection Scheme

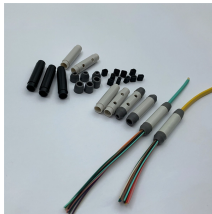

People have known to directly connect PCs (because they were "servers", in a sense) to "core switch" because they could not be bothered (or could not afford) to put an aggregate switch.

This determines network efficacy, dependability, and the speed at which information is exchanged. This article will discuss critical aspects of core switches, including their essential ...
