

Fiber optic pigtail insertion sequence

Overview

The sequence is as follows: When you are splicing a 12-strand trunk to a 12-strand pigtail kit, your job is to match these colors exactly. Blue splices to blue, orange to orange, and so on. This ensures that the fiber plugged into Port 1 on the local end actually comes out. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. Get the wrong connector type, the wrong polish, or skip proper fusion splicing technique—and you're looking at elevated signal loss, increased back reflection, and a. Installing fiber optic pigtails correctly is essential for ensuring low signal loss and long-term reliability. Remove the outer coating carefully to expose the fiber. Make a precise cut for optimal splicing. Typical applications include data centers, Broadband CATV, Passive Optical Network PON, WDM or DWDM multiplexing, FTTh, and voice services in ATM and SONET. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other.
