

High-precision MEMS optical switches for relay protection

Overview

Over the last 30 years, MEMS switches have been consistently touted as a superior replacement to limited performance electromechanical relays, and therefore revolutionizing how electronic systems are realized by providing an easy to use, small form factor switch that can. Over the last 30 years, MEMS switches have been consistently touted as a superior replacement to limited performance electromechanical relays, and therefore revolutionizing how electronic systems are realized by providing an easy to use, small form factor switch that can. MEMS-based switches offer high reliability that passed well over 10^9 cycles of switching tests. We offer both 2D and 1D movement-based MEMS switches. The 1D motion MEMS mirror (in or out of the light path) offers low crosstalk or high on/off ratio, fault-safe latching, free space platform. The 2D. Sercalo's optical MEMS switches are the best choice for optical switches in Network supervision and optical test and measurement because they exhibit solid state reliability, ultra small insertion loss and long-term stability. Since 1999 Sercalo Microtechnology Ltd. supplies optical MEMS solutions.

Mechanical Optical Switches: Switching times typically range from 1-10ms, suitable for long-distance transmission scenarios where latency is not critical

(such as backbone network protection switching). Solid-State Optical Switches: Based on thermooptic or electrooptic effects, response time can be. GEZHI's MEMS MxN Switch components are produced based on MEMS tilting mirror technology. This MEMS mirror platform has been built into millions of components for the optical networking industry. Over the last 30 years, MEMS switches have been consistently touted as a superior replacement to limited performance.
