

How to adjust the low sensitivity of the optical module

Overview

The results show that the low light sensitivity of the optical module can be optimized by shortening the length of the TIA-PD line within the allowable range of the chip equipment. Receiver sensitivity stands as a critical parameter impacting an optical transceiver's functionality. It denotes a module's capability to function in challenging environments and aids network operators in determining the system's maximum reach or link margin. Always look at the dBm value in product details. Once the optical signal falls below the receiving.
