

# Hybrid energy system with high temperature resistance for use in vehicle-mounted fiber optics

## Overview

In this paper, the electro-thermal modeling of HES is discussed. A simplified model is developed to address the challenges associated with solving nonlinear problems. This paper presents a comprehensive review of thermal management technologies for vehicle-mounted batteries, covering key aspects such as internal temperature estimation, conventional cooling methods (e., air cooling, liquid cooling, and phase change materials), and emerging thermoelectric data. The push toward higher efficiency and greater power density in Hybrid Electric Vehicle (HEV) and Electric Vehicle (EV) systems places immense thermal and mechanical stress on critical components, particularly inverters and converters. Among the available battery systems, lithium-based batteries are the most prominent due to their high energy storage density. The current research examines several hybrid BTMS configurations and compares them to existing BTMS. The study concentrates on the.
