When it comes to data center cabling, the two main contenders are copper and fiber optic cables. Each has its own strengths and weaknesses. The right choice depends on your specific requirements, including budget, distance,

speed, and scalability. One of the most important decisions in any commercial construction project is choosing between fiber optic and copper cabling. Choose wrong, and you're. While both copper and fiber optic cables are designed for data transmission, their core technologies, performance ceilings, and ideal deployment scenarios vary considerably. Fiber optic cable transmits data using light pulses through thin glass strands, whereas copper cable relies on electrical. Several factors are converging to drive the switch from copper to fiber - and cost is a big one.
