

Should large-pair cables be run in cable trays

Overview

For cables larger than 4/0 AWG, cables are installed in a single layer (no stacking) and the sum of cable diameters must not exceed the tray width. Cable tray is the preferred wiring method for industrial facilities, data centers, and large commercial buildings where routing dozens or hundreds of cables through individual conduits would be impractical and expensive. Provide good ventilation and easy cable tie-down. Here is the summary of the main points found in NEC Article. In this installment of our Code Corner series, Ryan Mayfield focuses on the 2023 National Electrical Code (NEC) changes concerning cable trays, particularly section 690. Historically, the NEC has allowed cable trays, but has lacked specific guidelines for sizing conductors and using smaller. This guide covers the critical steps, from selecting the right electrical cable tray and performing accurate cable fill calculations to managing a safe cable pull through and ensuring all bonding and grounding requirements are met. For licensed electricians, mastering these principles is essential.

Should large-pair cables be run in cable trays

In this article, we will explore the differences between should and shall, explain when and how we typically use these words, and provide examples of how we typically use them in sentences.

SHOULD definition: must; ought (used to indicate duty, propriety, or expediency). See examples of should used in a sentence.
