

Silicon Photonics for Active Optical Modules in the Internet of Things

Overview

Among numerous technological paths, silicon photonics has emerged as a strong contender, not only deeply penetrating the traditional FRO optical module domain but also making its mark in LPO (Low Power Optical Modules), TRO (Transparent Optical Modules), and CPO. Among numerous technological paths, silicon photonics has emerged as a strong contender, not only deeply penetrating the traditional FRO optical module domain but also making its mark in LPO (Low Power Optical Modules), TRO (Transparent Optical Modules), and CPO. Silicon photonics has developed into a mainstream technology driven by advances in optical communications. The current generation has led to a proliferation of integrated photonic devices from thousands to millions—mainly in the form of communication transceivers for data centers. It enables optical communication on a silicon platform, bringing together the speed of light with the scalability of CMOS. Optical modules have a wide range of applications, with access network optical modules accounting for less than 15% of the market, including PON modules for wired access and 5G fronthaul modules for wireless base stations. Building upon the mature infrastructure of complementary metal-oxide-semiconductor.
