

## The function of connecting flexible optical fibers to pigtails

### Overview

The bare end of the pigtail is spliced to the main cable, creating a permanent, low-loss connection. This splicing process helps integrate fibers into panels, switches, and transmission equipment without excessive bending or physical strain. 5m to 2m—that has a factory-terminated connector on one end and bare fiber on the other end. It acts as a bridge between optical fibers and devices, making it a vital part of network termination, splicing, and patching processes. What is a pigtail?

A pigtail is used to.
