

Thermal Deformation Characteristics of Fiber Bragg Gratings

Overview

The thermal decay characteristics of these gratings were investigated over a temperature range from room temperature to 950 ° C. A cation-hopping model is presented to account for the obvious differences between the FBGs in terms of their thermal properties. Strong fiber Bragg gratings (FBGs) with high-temperature sustainability were fabricated by writing the gratings into several specially developed photosensitive fibers. A. The thermal and deformation properties of fiber Bragg gratings (FBG) in the visible range were characterized for the first time in our knowledge. The FBG were written in silica single mode (cutoff in the visible and infrared range) and multimode fibers, using a phase-mask (460 nm period). involves highly nonlinear photo-ionization, thus requiring high intensity of light and it only occurs in a tightly focused laser beam. depend strongly on formation of defects. As a result, the decay of defects caused by thermal annealing is likely to be insignificant in the.
