

# What is an RFAL distribution box

## Overview

This new passive safety distribution 'R' box helps facilitate quick installation of safety systems by using quick disconnect (QD) patchcords that eliminate individual wiring to specific terminals inside the interlocks. It integrates different RF ICs (existing and future ST25R devices) into an easy-to-use common interface. This common interface makes the upper. RFAL merges traditional liposuction and radiofrequency energy to not only remove fat, but tighten skin, providing patients smoother contours with less invasiveness than classic surgical liposuction. It's a technique that employs a thermally controlled applicator and flexible cannula with real-time. The 'R' box complements the existing Rockwell Automation safety distribution boxes by adding circuitry to accommodate SensaGuard™ interlock switches and guardlocking interlock switches. The RFAL provides a common interface that makes the upper software layers independent from the used ST25R device. The RFAL with the same APIs is available for all ST25R devices, thus ...

The distribution box, also known as the D-box, is a junction box positioned between the tank and the drain field. Its primary function is to evenly distribute the septic tank effluent (wastewater) from the ...

RFAL applies skin tightening with heat, which can minimize surgical removal. While old-school liposuction gets rid of fat, it can leave loose skin behind in certain patients.

This distribution box is designed to accommodate SensaGuard interlock switches, tongue-operated interlock switches, the Lifeline™ cable pull switches, and tongue-operated guardlocking interlock ...

The RF abstraction layer is a library that provides several functionalities required to perform RF/NFC communications and other common related operations. It integrates different RF ICs (existing and ...

The RFAL simplifies the development of applications by encapsulating device and protocol details. It provides a common interface that makes the upper software layers independent from the used device.

RFAL technology uses external and internal electrode, connected by a handpiece, to create a thermal profile. During treatment the internal cannula is introduced into the adipose tissue and can be ...
