

Working principle of three-phase current protection device

Overview

The RCD works by sensing any difference between the current in the phase and the neutral lines and then tripping the power supply. It can detect any imbalance as low as 0. 3-phase power is a method of alternating current (AC) generation, transmission, and distribution that uses three electrical conductors, each carrying AC voltage of the same frequency and amplitude but offset by 120 degrees—one-third of a 360-degree cycle as shown in Figure 1—to provide that power. An SPD (Surge Protection Device) is a safety device found in electrical panels that protects equipment from voltage surges. In a normal three-phase system, the voltage between two phases is 415V. In industrial and commercial electrical systems, the 3 Phase Surge Protector (SPD) plays a critical role in preventing damage caused by transient overvoltages. In practice, it's installed at the origin of a 3-phase supply (such as a distribution board or consumer unit) and. Types and Working Principle Electricity helps run various devices such as computers, lights, refrigerators and air conditioners.
